$$
\begin{array}{ccc}
\Delta E_{\text {bind }}=-\Delta m c^{2} & c=\text { speed of light }\left(3.00 \times 10^{8} \mathrm{~m} / \mathrm{s}\right) & 1 \mathrm{eV}=1.69 \times 10^{-19} \mathrm{~J} \\
\left(1 \mathrm{~kg}=6.022 \times 10^{26} \mathrm{amu}, \text { or } 1 \mathrm{~g}=6.022 \times 10^{23} \mathrm{amu}=1 \mathrm{~mole} \mathrm{amu}\right) & 1 \mathrm{MeV}=1.69 \times 10^{-16} \mathrm{~J} \\
(1 \mathrm{Neutron}=1.008665 \mathrm{amu}) & (1 \text { Proton }=1.007825 \mathrm{amu}) \\
\ln \left(\frac{N}{N_{0}}\right)=-k t & t 1 / 2=\frac{\ln 2}{k}=\frac{0.693}{k} & N=N_{\mathrm{o}}\left(\frac{1}{2}\right)^{\frac{t}{t_{1 / 2}}}
\end{array}
$$

1. The change in energy of five cups of water $(1.25 \mathrm{~L})$ heated from $20.0^{\circ} \mathrm{C}$ to $85.0^{\circ} \mathrm{C}$ is
A. 340 kJ
B. 445 kJ
C. 129 kJ
D. 563 kJ

Use the following information to answer the next question.

2. Based on the graph above, the half-life of Cesium-137 is
A. 130 years
B. 65 years
C. 30 years
D. 2 years
3. If 72.1 kJ of energy are released, how many moles of oxygen gas would be consumed by the combustion of hydrogen gas to produce gaseous water?
A. 0.500 mol
B. 0.126 mol
C. 0.298 mol
D. 0.149 mol
4. The decomposition equation of sodium hydroxide is $\mathrm{NaOH}_{(\mathrm{s})} \rightarrow \mathrm{Na}(\mathrm{s})+1 / 2 \mathrm{O}_{2(\mathrm{~g})}+1 / 2 \mathrm{H}_{2(\mathrm{~g})}+425.6 \mathrm{~kJ}$. Determine the $\Delta H$ if 0.250 mol of oxygen gas was produced.
A. +213 kJ
B. -213 kJ
C. +426 kJ
D. -426 kJ

## Numerical Response

1. 100 mL of water at $75.0^{\circ} \mathrm{C}$ was cooled to $0.00^{\circ} \mathrm{C}$ by adding ice. All the ice melted. To the nearest tenth, the mass of ice added was $\qquad$ g .
2. 32.0 g of methane, $\mathrm{CH}_{4}$, is burned in a calorimeter and the heat released is enough to raise the temperature of 5.00 kg of water from $20.0^{\circ} \mathrm{C}$ to $27.7^{\circ} \mathrm{C}$. From this data, the molar heat of combustion of methane is
A. $-2.52 \mathrm{~kJ} / \mathrm{mol}$
B. $-80.9 \mathrm{~kJ} / \mathrm{mol}$
C. $-161 \mathrm{~kJ} / \mathrm{mol}$
D. $-870 \mathrm{~kJ} / \mathrm{mol}$
3. Which change produces the most energy?
A. Combustion of 1 mole of methane
B. Conversion of 10 moles of steam at $100^{\circ} \mathrm{C}$ to ice at $-40^{\circ} \mathrm{C}$
C. Neutralization of 1 mole of acid
D. Nuclear fission of 0.1 mole of uranium
4. The majority of energy obtained from the burning of a hydrocarbon, gasoline for example, is due to
A. chemical bonds being broken.
B. intermolecular attractions.
C. molecule-to-molecule interactions.
D. transformation of mass to energy in the nucleus.
5. Of the following compounds, which one requires the most energy to decompose it into its elemental parts?
A. $\mathrm{H}_{2} \mathrm{~S}_{(\mathrm{g})}$
B. $\mathrm{H}_{2} \mathrm{O}_{2(I)}$
C. $\mathrm{HClO}_{4(l)}$
D. $\mathrm{HI}_{(g)}$
6. If the desired reaction can be written as the algebraic sum of a number of reactions, then the heat of the desired reaction can be written as
A. algebraic difference of the heats of reaction.
B. heat of the reaction of the most reactions.
C. algebraic sum of the heats of reaction.
D. heat of reaction containing compounds.
7. The majority of the energy that we use in society today is from
A. the combustion of fossil fuels.
B. hydroelectricty energy.
C. nuclear energy.
D. electrical energy from solar cells.

## Numerical Response

2. Benzene is a gasoline additive. The heat of formation for 1.00 mol of benzene is $\qquad$ kJ.
Use the following information to answer the next question.
Prior to an experiment, the following information was obtained from a chemistry reference source:

$$
\begin{aligned}
1 / 2 \mathrm{H}_{2(g)}+1 / 2 \mathrm{I}_{2(s)} \rightarrow \mathrm{HI}_{(g)} & \Delta H & =+25.9 \mathrm{~kJ} \\
\mathrm{I}_{2(s)} \rightarrow \mathrm{I}_{2(g)} & \Delta H & =+61.8 \mathrm{~kJ}
\end{aligned}
$$

11. The predicted $\Delta H$ value for the reaction represented by the equation $\mathrm{H}_{2(\mathrm{~g})}+\mathrm{I}_{2(\mathrm{~g})} \rightarrow 2 \mathrm{HI}_{(\mathrm{g})}$ should be
A. +113.6 kJ
B. +87.7 kJ
C. -10.0 kJ
D. -35.9 kJ

Use the following information to answer the next question.
A student performs an experiment using a calorimeter that contains water. The following is a graph produced from the data.

12. The best interpretation from the data is that the reaction is
A. endothermic and that the kinetic energy of the water is decreasing
B. endothermic and that the kinetic energy of the water is increasing
C. exothermic and that the kinetic energy of the water is decreasing
D. exothermic and that the kinetic energy of the water is increasing

Use the following diagram to answer the next question.

13. The diagram could apply to a nuclear reaction or a chemical reaction. However, in the
A. nuclear reaction, section $B$ will be much larger than in the chemical reaction
B. nuclear reaction, section B will be much smaller than in the chemical reaction
C. nuclear reaction, section C must be above section A
D. chemical reaction, section C must be above section A

Use the following information to answer the next question.

$$
\begin{array}{rlrl}
7 \mathrm{C}_{(\mathrm{s})}+7 \mathrm{H}_{2(\mathrm{~g})} & \rightarrow \mathrm{C}_{7} \mathrm{H}_{14(\mathrm{l})} & \Delta H & =-62.1 \mathrm{~kJ} \\
\mathrm{C}_{(\mathrm{s})}+\mathrm{O}_{2(\mathrm{~g})} & \rightarrow \mathrm{CO}_{2(\mathrm{~g})} & \Delta H & =-393.5 \mathrm{~kJ} \\
\mathrm{H}_{2(\mathrm{~g})}+1 / 2 \mathrm{O}_{2(\mathrm{~g})} & \rightarrow \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})} & \Delta H=-241.8 \mathrm{~kJ}
\end{array}
$$

## Numerical Response

3. To the nearest tenth, the amount of heat released when 1.80 g of $\mathrm{C}_{7} \mathrm{H}_{14(I)}$ are burned is $\qquad$ kJ.
4. Which of the following statements is true for an endothermic reaction?
A. Change in potential energy for the reaction is negative.
B. Energy is a product in the chemical equation.
C. The temperature of the surroundings increases.
D. The potential energy of the products is greater than the potential energy of the reactants.
5. In the reaction $\mathrm{C}_{25} \mathrm{H}_{52(\mathrm{~s})}+38 \mathrm{O}_{2(\mathrm{~g})} \rightarrow 25 \mathrm{CO}_{2(\mathrm{~g})}+26 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$, the energy released by the reaction of the paraffin fuel is called the molar enthalpy of
A. formation
B. vaporization
C. combustion
D. decomposition

Use the following information to answer the next question.
Phosphorus, $\mathrm{P}_{4(s)}$, reacts spontaneously with chlorine gas to form solid phosphorus pentachloride. In carrying out this reaction, the following data were collected:

| Mass of calorimeter water | 0.800 kg |
| :--- | :--- |
| Initial temperature of water | $21.3^{\circ} \mathrm{C}$ |
| Final temperature of water | $32.8^{\circ} \mathrm{C}$ |
| Mass of phosphorus | 3.10 g |
| Mass of chlorine | excess |

## Numerical Response

4. To the nearest $\mathrm{kJ} / \mathrm{mol}$, the experimental value for the heat of formation of $\mathrm{PCl}_{5(\mathrm{~s})}$ is - $\qquad$ $\mathrm{kJ} / \mathrm{mol}$.

Use the following diagram to answer the next question.

16. If AB represents the product of a chemical reaction, the reaction is one in which
A. potential energy increases
B. energy is released
C. heat is absorbed
D. $\Delta H$ is positive

Use the following information to answer the next question.
A particular nuclear fission reaction of uranium-235 is represented by

$$
{ }_{92}^{235} \mathrm{U}+{ }_{0}^{1} \mathrm{n} \rightarrow{ }_{55}^{141} \mathrm{Cs}+{ }_{c d}^{a b} \boldsymbol{X}+3{ }_{0}^{1} \mathrm{n}
$$

where element $\boldsymbol{X}$ is unknown.

## Numerical Response

5. The fission product in this reaction is represented by ${ }_{c d}^{a b} \boldsymbol{X}$.

The values of $\boldsymbol{a}, \boldsymbol{b}, \boldsymbol{c}$, and $\boldsymbol{d}$ are $\qquad$ , $\qquad$ , $\qquad$ , and $\qquad$ .

Use the following information to answer the next question.
A student was given the following equation.

$$
2 \mathrm{Na}_{(\mathrm{s})}+2 \mathrm{H}_{2} \mathrm{O}_{(\mathrm{l})} \longrightarrow 2 \mathrm{NaOH}_{(\mathrm{s})}+\mathrm{H}_{2(\mathrm{~g})}
$$

## Numerical Response

6. To the nearest kJ , the heat of reaction of the above balanced equation is - $\qquad$ kJ.

Use the following information to answer the next question.
Molar Heats of Formation for Silicon Halides

| $\mathrm{SiF}_{4(g)}$ | $-1617 \mathrm{~kJ} / \mathrm{mol}$ | $\mathrm{SiBr}_{4(\mathrm{l})}$ | $-458 \mathrm{~kJ} / \mathrm{mol}$ |
| :--- | :--- | :--- | :--- |
| $\mathrm{SiCl}_{4(\mathrm{l})}$ | $-688 \mathrm{~kJ} / \mathrm{mol}$ | $\mathrm{SiI}_{4(\mathrm{~s})}$ | $-190 \mathrm{~kJ} / \mathrm{mol}$ |

17. Which silicon halide is the most stable?
A. $\mathrm{SiF}_{4}(\mathrm{~g})$
B. $\mathrm{SiCl}_{4(I)}$
C. $\mathrm{SiBr}_{4(l)}$
D. $\mathrm{SiI}_{4(\mathrm{~s})}$
18. The Euglena is an organism that can produce glucose by photosynthesis when light is present. The major energy conversion in the Euglena, in the presence of light, is best described as
A. exothermic, with a decrease in kinetic energy
B. exothermic, with a decrease in potential energy
C. endothermic, with an increase in kinetic energy
D. endothermic, with an increase in potential energy
19. Nuclear radiation exists in several different forms. Listed from greatest to least in their ability to penetrate human tissue, the order of three of these forms is
A. alpha, beta, gamma
B. gamma, beta, alpha
C. gamma, alpha, beta
D. alpha, gamma, beta

## Numerical Response

7. An outdoor mercury thermometer contains 1.02 g of mercury. On a winter day, the thermometer records a change in temperature from $-38.0^{\circ} \mathrm{C}$ to $-13.0^{\circ} \mathrm{C}$. To the nearest hundredth, the amount of energy the mercury absorbs is $\qquad$ J.

## Use the following information to answer the next two questions.

Limestone is used as a raw material in the production of lime, which has a wide range of industrial applications. Lime, $\mathrm{CaO}_{(\mathrm{s})}$, in the plant is produced by roasting crushed limestone, $\mathrm{CaCO}_{3(\mathrm{~s})}$, in kilns. The process of removing carbon dioxide from the limestone is referred to as calcination. The lime can be used to produce slaked lime, $\mathrm{Ca}(\mathrm{OH})_{2(s)}$, through the careful addition of liquid water.

The demand for lime and slaked lime had increased in the last few years because it can be used in the treatment of industrial wastes and raw sewage, and in the purification of water.
20. The molar heat of reaction for the production of lime from limestone is
A. $-634.9 \mathrm{~kJ} / \mathrm{mol}$
B. $+1207.6 \mathrm{~kJ} / \mathrm{mol}$
C. $+179.2 \mathrm{~kJ} / \mathrm{mol}$
D. $-179.2 \mathrm{~kJ} / \mathrm{mol}$
21. The production of slaked lime from lime can be classified as an
A. exothermic phase change
B. endothermic chemical change
C. endothermic phase change
D. exothermic chemical change

## Part B: Written Response

1. A student performed an experiment during which 17.04 g of hydrogen sulfide gas were burned in a calorimeter to form $\mathrm{H}_{2} \mathrm{O}_{(\mathrm{g})}$ and $\mathrm{SO}_{2(\mathrm{~g})}$. The heat produced was used to heat 1.50 L of water from $14.60^{\circ} \mathrm{C}$ to $55.20^{\circ} \mathrm{C}$.
a. Write the balance equation. Using the Standard Molar Enthalpies of Formation provided in the data booklet, calculate the molar heat of combustion of $\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})$.
b. Clearly draw and label the potential energy diagram that represents the combustion of one mole of gaseous hydrogen sulfide.
c. Use the student's data to determine the experimental value for the molar heat of combustion of $\mathrm{H}_{2} \mathrm{~S}(\mathrm{~g})$.
d. List one factor and how it may account for any difference between $\Delta H$ values in part a and part $\mathbf{c}$.
2. Tritium, ${ }^{3} \mathrm{H}$, is a radioisotope of hydrogen having a half-life of 12.3 years.
(4 marks)
a. Calculate the decay rate of the tritium. Include proper unit.
b. How long does it take to for a sample of tritium to decay to $5 \%$ of the original amount?
3. Uranium- 235 has an atomic mass of 235.0439 amu .
a. Determine the mass defect (in amu) of U-235.
b. Calculate the binding energy of U-235 in J/nucleus and $\mathrm{kJ} / \mathrm{mol}$.

## Part A: Multiple Choice and Numerical Response

1. A
2. C
3. D
4. B
5. B
6. D
7. A
8. B
9. C
10. A
11. C
12. A
13. A
14. D
15. C
16. B
17. A
18. D
19. B
20. C
21. D

## Numerical Response (2 marks each for answers below)

## Part B: Written Response

1. a. $\Delta H_{\mathrm{rxn}}=-518 \mathrm{~kJ} / \mathrm{mol}$ of $\mathrm{H}_{2} \mathrm{~S}$ burned
c. Experimental $\Delta H_{\mathrm{rxn}}=-510 \mathrm{~kJ} / \mathrm{mol}$ of $\mathrm{H}_{2} \mathrm{~S}$ burned
d. Some Possible Errors:

- Heat Lost due to imperfect calorimeter (lack of insulation).
- Did not account for heat gained from the calorimeter container.
- Did not account for gas expansion of the products and consequently work done by the system to lower the heat generated.
b.

2. a. $0.0563 \mathrm{yr}^{-1}$
b. 53.2 yrs
3. a. -1.915095 amu
b. $\quad 2.86 \times 10^{-10} \mathrm{~J} /$ nuclueus $=1.72 \times 10^{11} \mathrm{~kJ} / \mathrm{mol}$
